*Lilium Speciosum Album*

## **LILIUM SPECIOSUM**

The bulbs of this beautiful Lily have practically disappeared from world markets since 1940. For Spring delivery, we have retarded in cold storage, an ample supply of heavy clean bulbs, comparable to those delivered in the past. Most valuable for borders or as a pot plant; it is also unsurpassed as a cut flower lasting from ten days to two weeks. Entirely hardy. Planted in clumps it naturalizes and increases its blooms perennially. Plant as soon as the ground is open in the Spring, for bloom in August-September. For prices and other Lilies, see pages 84 and 85.

# MASON'S GOLDEN MIDGET CORN

THE WORLD'S SWEETEST  
SWEET CORN

# *There's No Corn as Sweet as* **MASON'S GOLDEN MIDGET**

*Kennedy's Most Popular Introduction in Thirty Years*

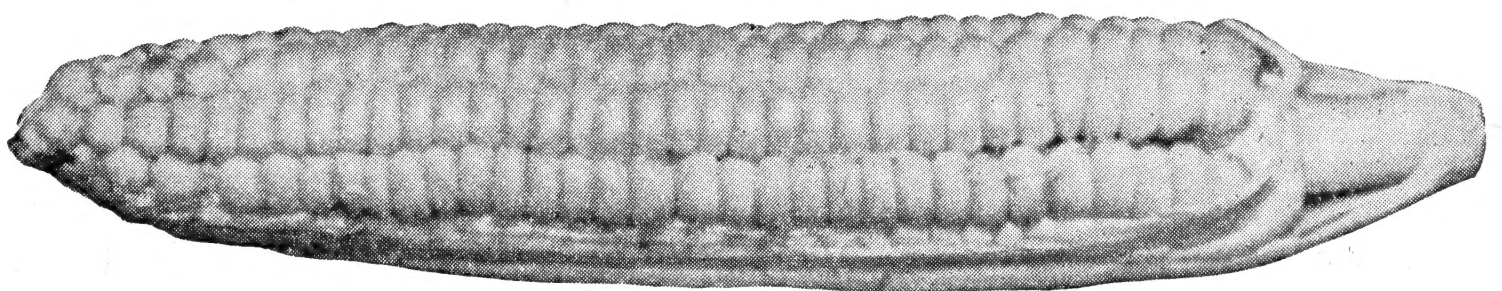

There is no other Corn of such succulent sweetness as Mason's Golden Midget. A real dainty delicacy; ears not over four inches long. Its delicious, deep kernels give a real bite. Grows on miniature plants rarely exceeding a height of three and one-half feet and can be sown in rows, thinning the plants out to six inches apart, allowing 24 inches between the rows. Each plant carries three to five ears about four inches long. For a continuous supply, successive sowings should be made every ten days until July 10th in the latitude of New York. **MASON'S GOLDEN MIDGET SWEET CORN** maturing in 56 days should be planted whether your garden is limited to square feet or acres.

*This is the very best corn for deep freezing as it does not lose its delicious flavor or tenderness.*

We have received testimonials from growers all over the United States commending us on the quality and all around goodness of this introduction.

500 seeds, \$1.00**

### ASPARAGUS ROOTS

Fr., *Asperge*; Ger., *Spargel*; Sp., *Esparrago*;  
It., *Asparagi*

Asparagus roots should be planted in trenches, which should be prepared at least 2 ft. deep and 1 ft. wide, or three rows may be planted in a bed 5 ft. wide. The excavated soil should be placed on each side of the trench; then put in a layer of barnyard manure four inches deep in the bottom of the trench; if manure is not available, use other matter rich in organic material.

With a spading fork work this manure into the subsoil, then fill back the excavated soil to within six inches of the garden grade and your trench is now ready to receive the crowns which should be placed a foot apart and covered with about 2 inches of soil after the roots have been carefully spread out. Do not cut any asparagus the first year as the plant has to build up a good root system and strong crowns before it can really produce. In the late fall, following planting, clear off all tops. The following spring the excess soil on the side of the trench can be filled in and the bed is complete. If the bed is given an annual dressing of a complete fertilizer, cultivated and kept free from weeds, it will give an abundance of asparagus for many years.

**Pedigreed Mary Washington.** There is no strain of the Washington nearly as good as the "Mary." Earlier, more productive, larger stalks and possesses highest rust resistance.

## **How to Make a Lawn**

The ground should be thoroughly prepared; that is, the soil should be fertilized, then turned over to a depth of 6 inches and pulverized. Sow good seed (which is very essential) roll the ground and cross roll in order to press the seed firmly into the soil. The proper time to sow grass seed depends upon the latitude. In the central and eastern states seed may be sown from March 1st to the end of June. Seed may be sown in the fall, from the first part of August to the end of October. Sow, if possible, when ground is moist. For seeding a new lawn use 150 to 200 lbs. per acre.

### **KENNEDY'S GREENTURF LAWN GRASS SEED MIXTURE**

(Formerly Kennedy's Green Velvet)

This is the lawn grass seed mixture which for over 30 years has seeded many of the most beautiful lawns in America under the name of Kennedy's Green Velvet Lawn Grass Seed Mixture. Recently worthless mixtures bearing the trade name "Green Velvet" have been marketed to the confusion of our patrons. To avoid this confusion we have changed the name to **Kennedy's Greenturf Lawn Grass Seed Mixture**. The seed in this mixture is all re-cleaned and especially adapted to withstand the heat and drought of the summer. When properly sown and cared for **Greenturf** will produce a beautiful green lawn the entire season.

## KENNEDY'S BENTURF LAWN GRASS SEED MIXTURE

(Reg. U. S. Pat. Off.)

(Bent Formula)

The popularity of golf in recent years has made comparison of lawns and putting greens an easy matter. One hardly expects his lawn to look as perfect as a putting green, but this is possible if sown with Kennedy's Benturf Lawn Grass Seed Mixture. With reasonable preparation and care excellent results have been accomplished with our Kennedy's Benturf Lawn Grass Seed Mixture which contains a large amount of Bent seed. This makes a compact, rapid growth forming a close sward withstanding wear and tear.

## KENNEDY'S KARPETURF LAWN GRASS SEED MIXTURE

This mixture is comprised of some of the quick germinating grasses as well as larger proportions of the permanent, deep rooted varieties. It has been tried in a great many sections of the country and has given excellent results where a quick cover was desired and has proven particularly adaptable for sowing on old lawns which have become shoddy and in need of renovating.

## KENNEDY'S TERRACE MIXTURE

A mixture of strong, deep-rooted grasses for banks and terraces. Although the grasses are strong and deep-rooted, they will produce a fine, green velvety surface, and also prevent washing away during heavy rains.

## LAWN CLOVER—DWARF WHITE

The only variety suitable for lawns. Very dwarf and of a spreading habit. We advise sowing White Clover separately on account of the seed being much heavier than that of the finer grass seed. It has a tendency to work to the bottom of the receptacle it is being sown from and consequently the last part of the grass seed sown has greater percentage of clover than the first.

## KENNEDY'S PASTURE MIXTURES FOR PERMANENT PASTURE AND HAY CROPS

Our Permanent Pasture Grass Seed Mixtures contain only grasses most suitable for this purpose. The result of sowing Kennedy's Permanent Pasture Mixture is a successive growth of rich, succulent grasses from early spring until late fall.

We recommend, in good soil, sowing 80 lbs. per acre, or in poor soil, 100 lbs. per acre. We also suggest sowing an additional 10 lbs. of Red Clover, in either case, to the acre.

Permanent Pasture Grass seed may be sown either spring or fall, but we advise sowing Clover in the spring only.

When ordering state whether your soil is sand, clay, moist or dry, so that the proper proportions of the various grasses may be used.

#### Wilt-Resistant

The aster wilt disease is caused by a parasite fungus which, when once in the soil, will attack any aster planted in the place at any time. Only through the use of wilt-resistant strains is it possible to grow asters more than one year in the same soil. We offer the following wilt-resistant varieties:

## Kennedy's Long-Stemmed Imperial Giants

The pansy has been a garden favorite since the middle of the 17th century. In recent years, hybridizers have developed the size of flower and length of stem to such an extent as to make descriptions inadequate. To convey a true picture of the infinite perfection of form, range of color, texture of petals, and length of stem, produced by our mixture of Long-Stemmed Imperial Giants is impossible.

Several years ago we offered Kennedy's Long-Stemmed Imperial Giants in mixture only. With their free-flowering habit and wide range of sombrous shades of soft velvet, we do not hesitate to proclaim Kennedy's Long-Stemmed Imperial Giants the finest Pansies in cultivation today.

We now offer this same strain in fixed named varieties, in addition to the mixture. Because the best flowers are shy seeders, the price of a good strain is necessarily high.

## DIELYTRA SPECTABILIS

(Bleeding Heart)

Upon receiving the roots they should all be potted into six- or eight-inch pots. If it is desired to force one plant at a time, place the first potted plant in a room where it may receive exposure to the sun for some part of the day. Water moderately and do not allow it to dry out but do not soak it. Plants (in the pots) that are to be reserved for later forcing should be left out of doors and covered with hay, straw, leaves or some such material so that they will remain moist but still available for bringing into the house when it is desired to force them. Freezing outside will not injure them in the least. Room temperature is generally suitable for forcing but they will do better if somewhat on the cool side. Forcings may be started off at intervals as desired — say two weeks apart. Flowering will take place in from three to six weeks according to temperature and season forced as plants flower in a much shorter period of time as the season advances. After flowering the plant may be kept and planted out in the garden in the early spring.

# Kennedy Kwality Exhibition Gladiolus

## Our Glads Are Free from Thrip!

Due, no doubt, to scientific treatment of planting stock for years our gladioli have always been free from thrip. As an added precaution and to be sure that bulbs supplied by us are absolutely free from this pest, we will also scientifically treat our bulbs again before shipment is made to our customers.

Inasmuch as thrip lives in the soil, as well as on the bulbs in storage, through the winter, it is imperative that our bulbs be planted on soil where gladioli were not grown last year and not close to other gladioli from other sources.

We guarantee our bulbs to be the largest size and well matured, which is absolutely essential for producing exhibition flowers.

## Hardy Everblooming Roses

Extra Heavy, Hardy Northern Nursery-Grown Stock

The roses offered in this list are of the Hybrid Tea class, which are commonly known as ever-blooming roses, and are without exception the most desirable for bedding. The stock we offer is extra heavy, northern nursery-grown, which, if planted in the early spring, are guaranteed to bloom from June until frost, and are not to be confused with the stock which has been forced in greenhouses all winter and after being discarded by growers because of weakened condition due to hard forcing, is offered for sale as flowering stock by unscrupulous dealers.

Budded plants are more vigorous, produce more and better flowers, are more hardy and less susceptible to disease.

Because of the very great shortage of good rose stock available this year we will only be able to supply the varieties as listed on these pages and due to this shortage some of these varieties will be sold out very early. We would appreciate, if you would state, when placing your order, that we may substitute an equally good variety in the same color.

## IMP

### The Best Fertilizer for the Grower

Owing to the war, the importation of fertilizers from England was stopped. The manufacturer of IMP, after canvassing competing formulas, found one that was apparently beyond criticism and that one was "Clay's," a fertilizer manufactured in England and used there by the growers almost to the exclusion of other mixed fertilizers.

As the manufacturers of IMP imported large quantities of "Clay's" fertilizer for years and were familiar with the high regard in which it was held by their trade, they made a complete analysis of the composition and the method of its manufacture. They found the formula could be duplicated and placed IMP on the market in January, 1940. At the present time there are hundreds of leading commercial growers using IMP.

**56-lb. bag \$7.00, 112-lb. bag \$12.00**

# Kennedy Kwality Pot-Grown READY-TO-PLANT STRAWBERRY PLANTS

We are not able to fill orders for less than twenty-five plants of a variety.

We consider the following June and July bearing varieties the best yet introduced.

## EARLY BEARING VARIETIES

**Dorsett.** Originated by the U. S. Department of Agriculture, and now considered one of the very best of the early sorts. A heavy producer of firm, shapely berries, which are bright, rich red, and of delicious flavor.

25 \$3.50, 100 \$12.00

**Maytime.** Originated by the U. S. Department of Agriculture, this extra early variety produces high quality berries which are medium to large in size, and of handsome appearance.

25 \$3.50, 100 \$12.00

## MIDSEASON VARIETIES

**Fairfax.** Ripening just after Dorsett, this remarkable berry rules the second-early market. The solid berries, which ripen evenly to a deep red, hold their firmness and flavor well; perfect for canning.

25 \$3.50, 100 \$12.00

**Chesapeake.** Midseason to late. Most popular berry of its season, with beautiful, big, bright red berries, deliciously mild and sweet.

25 \$3.50, 100 \$12.00

## LATE VARIETIES

**Red Star.** Very late. Originated by the U. S. Department of Agriculture. The berries are large, glossy, bright red and do not turn

dark. Considered more productive and of better quality than Gandy. 25 \$3.50, 100 \$12.00

**Starbright.** Late. Originated by the U. S. Department of Agriculture. Outstanding for its great beauty and excellent quality. The large, glossy, bright red, firm berries are produced in abundance.

25 \$3.50, 100 \$12.00

## EVERBEARING STRAWBERRIES

For best results newly set plants of everbearing strawberries should be disbudded up to July 1st. Plants will then produce a fine crop of large, luscious berries during late summer and fall.

**Brunes Marvel**—We cannot recommend this variety too highly. It has all the good qualities of the other varieties and no faults that we can find. Very prolific, producing large berries of exceptional sweetness, almost entirely free from acid. We have increased our stock considerably this past season and hope to be able this year to fill all orders received for this variety.

25 \$7.50, 100 \$25.00

**New Gem.** The Everbearing Sensation, producing bright, sparkling red berries, uniformly large in size. They are solid red to the center, juicy, deliciously sweet, and very free from acid. Enormous crop in all types of soil.

25 \$4.50, 100 \$15.00

# KENNEDY KWALITY STRAWBERRY PLANTS

Pot-grown strawberry plants planted in the early spring will produce a fair amount of fruit in June. Greater plant growth, however, will be induced by pinching out the flowers as they appear, thus throwing growth into the plants for the following year.

## CULTURAL DIRECTIONS

Set the plants 12 to 15 inches apart in the row. Rows should be 2 to 3 feet apart, depending upon the amount of space you wish to devote to the strawberry bed. Kept clean from weeds a bed will last four to five years, but the usual practice is to replant every two or three years. Generally the older the bed becomes the smaller the fruit; but proper care (freedom from weeds) and correct fertilization does much to offset this and prolong the life of the bed.

After plowing or spading the intended bed, apply garden fertilizer, broadcast at the rate of approximately five pounds per 100 square feet, and work into the soil thoroughly. Later on, after the plants have been established for three or four weeks, a moderate amount of fertilizer may be applied along the row but care must be exercised not to burn the plants. Do not over-do fertilization. Bone meal is a good safe fertilizer that does not burn. During the life of the bed fertilize once every year in February.
